# 1 Introduction and Targets

The content of this course will be the followings:

- Polynomial Methods in Combinatorics/Geometry
  1. Kakeya/Nikodym Problem over finite fields
  2. Joints Problem
  3. Combinatorial Nullstellensatz (CN)
  4. CN proof of Cauchy-Devenport, Erdős-Heilbronn Conjecture
- Polynomial Methods in Algebraic Algorithms
  1. Noisy Polynomial Interpolation (Sudan, Guruswami-Sudan)
  2. Multiplicative noise (Von zur Gathen-Shparlinski)
  3. Coppersmith's Problem (Given an univariate  $f(x) \in \mathbb{Z}[x]$ , compute all 'small' integer roots modulo a composite)
- Polynomial Methods in Circuit Complexity
  1. Razborov-Smolensky (Lower Bound for constant depth AND, OR, NOT,  $\text{mod } p$  gates)
  2. Algorithmic consequences (all pairs shortest paths)
  3. Upper bounds on matrix rigidity (Alman-Williams '2015, Dvir-Edelman '2017)
- Polynomial in Property Testing: Polischuk-Speilman Lemma/Variants
- Weil Bounds (Stepanov, Schmidt Bombieri)
- Rational Approximations of Algebraic Numbers (Thue[1907] - Siegel - Roth[1954])

## 2 Joints Problem

## 3 Combinatorial Nullstellensatz

### 3.1 Chevally-Waring Theorem

## 4 Sum Sets

### 4.1 Sum Sets over Finite Fields

#### 4.1.1 Cauchy-Davenport Theorem

### 4.2 Restricted Sum Sets

#### 4.2.1 Erdős-Heilbronn Conjecture

## 5 Arithmetic Progression Free Sets in $\mathbb{F}_3^n$

### 5.1 3AP Free sets in $\mathbb{F}_q$

## 6 3-Tensors and Slice Rank

### 6.1 Rank

### 6.2 Generalization to 3-Dimension

### 6.3 Slice Rank of Diagonal 3D Tensor

## 7 Kakeya and Nikodym Problem

### Definition 7.0.1: Kakeya Sets

In a finite field  $\mathbb{F}_q$ ,  $K \subseteq \mathbb{F}_q^n$  is a Kakeya Set if  $\forall a \in \mathbb{F}_q^n, \exists b \in \mathbb{F}_q^n$  such that

$$L_{a,b} = \{b + at : t \in \mathbb{F}_q\} \subseteq K$$

i.e. informally it has a line in every direction

Now notice that we can take the whole  $\mathbb{F}_q^n$  as the Kakeya Set. We can also remove a point from  $\mathbb{F}_q^n$  and it will still be a Kakeya Set. Having defined the Kakeya sets the biggest question which is studied is:

### Question 7.1

How small can a Kakeya Set be?

### 7.1 Lower Bound on Nikodym Sets

### 7.2 Lower Bound on Kakeya Sets

#### 7.2.1 Hasse Derivative

## 8 Razborov Smolensky Lower Bound

The result we will discuss the result that majority is strictly harder than the parity for  $AC^0$ , since there is no polynomial-size  $AC^0$  circuit to compute majority even if we are given parity gates. The result is Razborov's, and the proof technique uses ideas due to both Razborov and Smolensky.

Consider the class  $AC^0$  of polynomial size circuits with constant depth with unbounded fan-in. We consider the class  $AC^0(\oplus)$  where we give the parity gates  $\oplus$  which outputs 1 if an odd number of its inputs are 1. The main theorem which we will prove in this section is:

**Theorem 8.1 Razborov-Smolensky**

For any  $d \in \mathbb{N}$  any any depth  $d$   $AC^0(\oplus)$  circuit for MAJORITY has size  $\geq 2^{\Omega(n^{\frac{1}{2d}})}$

## 8.1 Two Parts of Proving Lower Bound

The proof of the above theorem requires two lemmas:

**Lemma 8.1.1**

$\forall \epsilon > 0$  and  $d \in \mathbb{N}$  the following is true:

If  $f : \{0, 1\}^n \rightarrow \{0, 1\}$  can be computed by a size  $s$  depth  $d$   $AC^0(\oplus)$  circuit then  $\exists$  a polynomial  $g$  in  $n$  variables and  $\deg O(\log \frac{s}{\epsilon})^d$  such that

$$\mathbb{P}_{a \in \{0,1\}^n} [f(a) = g(a)] \geq 1 - \epsilon$$

**Lemma 8.1.2**

For all polynomials  $p(x_1, \dots, x_n)$  with  $\deg p = t$ ,

$$\mathbb{P}_{a \in \{0,1\}^n} [g(a) = \text{MAJ}(a)] \leq \frac{1}{2} + O\left(\frac{t}{\sqrt{n}}\right)$$

Now first we will show that with these two lemmas we can prove Razborov-Smolensky Lower Bound for MAJORITY function

**Proof of Theorem 8.1:** Suppose MAJ has a  $AC^0(\oplus)$  circuit of size  $< 2^{n^{\frac{1}{2d}-\delta}}$

Lemma 8.1.1  $\implies \exists$  polynomial  $g$  of degree  $n^{\frac{1}{2d}-\delta}$  that approximates MAJ with error 0.1.

Lemma 8.1.2  $\implies \forall$  polynomial  $g$  of deg  $n^{\frac{1}{2d}-\delta}$  the error is  $\geq 1 - \left[ \frac{1}{2} + O\left(\frac{n^{\frac{1}{2d}-\delta}}{\sqrt{n}}\right) \right] \geq \frac{1}{2} - \left[ \frac{1}{2} + O\left(\frac{n^{\frac{1}{2d}-\delta}}{\sqrt{n}}\right) \right] \geq \frac{1}{2} - o(1)$

But  $\frac{1}{2} - o(1) < 0.1$  is contradiction. ■

**Alternate Proof Theorem 8.1:** Suppose  $C$  be an  $AC^0(\oplus)$  circuit of size  $s$  and depth  $d$  computing MAJORITY

Lemma 8.1.1  $\implies \exists$  polynomial  $g$  of degree  $O(\log \frac{s}{\epsilon})^d$  with error probability  $\leq \epsilon$ .

Lemma 8.1.2  $\implies \forall$  polynomial  $g$  of deg  $O(\log \frac{s}{\epsilon})^d$  the error is  $\geq \frac{1}{2} + O\left(\frac{(\log \frac{s}{\epsilon})^d}{\sqrt{n}}\right)$ .

Hence from these two results and setting  $\epsilon = 0.1$  we have

$$\frac{1}{2} + O\left(\frac{(\log \frac{s}{\epsilon})^d}{\sqrt{n}}\right) \geq 1 - \epsilon \implies (\log 10s)^d \geq \sqrt{n} \implies s \geq 2^{\Omega(\frac{1}{2d})}$$
■

Now that we proved our main objective theorem we will focus on proving the 2 lemmas in the following two sections.

## 8.2 Approximating Boolean Function with Polynomials

We first state and prove a lemma showing that every  $AC^0(\oplus)$  circuit can be approximated by a low degree polynomial i.e. Lemma 8.1.1. But to prove that we will show a more stronger lemma and then the lemma follows as a simple corollary of this stronger result.

**Lemma 8.2.1**

For all  $AC^0(\oplus)$  circuits  $C$  of size  $s$  of depth  $d$  and  $\forall \epsilon > 0$  there exists a distribution  $\mathcal{D}$  of polynomials  $p(x_1, \dots, x_n) \in \mathbb{F}_2[x_1, \dots, x_n]$  such that for all  $a \in \{0, 1\}^n$

$$\mathbb{P}_{p \in \mathcal{D}} [p(a) = C(a)] \geq 1 - \epsilon$$

where  $\mathcal{D}$  is supported on polynomials of degree  $\leq (\log \frac{s}{\epsilon})^d$

**8.3 Low Degree Polynomials Can't Approximate MAJORITY**
