Problem 1

(a) Prove that if $A_1, A_2, ..., A_n$ are events, then

$$\mathbb{P}\left(\bigcup_{i=1}^{n} A_{i}\right) = S_{1} - S_{2} + S_{3} - \dots + (-1)^{n-1} S_{n}$$

where

$$S_{1} = \sum_{i} \mathbb{P}(A_{i})$$

$$S_{2} = \sum_{i < j} \mathbb{P}(A_{i} \cap A_{j})$$

$$S_{3} = \sum_{i < j < k} \mathbb{P}(A_{i} \cap A_{j} \cap A_{k})$$
...

 $S_n = \mathbb{P}(A_1 \cap A_2 \cap \ldots \cap A_n)$

This is also known as the *inclusion-exclusion* principle.

(b) Bonferroni inequalities state that the sum of the first terms in the right-hand side of the identity we proved above is alternately an upper bound and a lower bound for the left-hand side. i.e., for odd $k \le n$,

$$P\left(\bigcup_{i=1}^{n} A_i\right) \le S_1 - S_2 + \dots + S_k$$

and for even $k \le n$

$$P\left(\bigcup_{i=1}^{n} A_i\right) \ge S_1 - S_2 + \dots - S_k$$

Note that from what we showed above Bonferroni inequality holds with equality for k = n.

Prove Bonferroni inequalities. Observe that the case of k = 1 is what you know as the *union bound* or Boole's inequality.

Solution:

Problem 2

Prove or disprove the following:

- The conditional independence of *A* and *B* given *C* implies *A* and *B* are independent.
- Independence of *A* and *B* implies the conditional independence of *A* and *B* given *C*.

If you disproved either of the claims above, for which events *C* is it then the case that the following statement holds: for all events *A* and *B*, the events *A* and *B* are conditionally independent given *C* if and only if *A* and *B* are independent.

Solution:

Problem 3

Let A_1, A_2, \dots be a sequence of events. Define

$$B_n = \bigcup_{m=n}^{\infty} A_m$$
 $C_n = \bigcap_{m=n}^{\infty} A_m$

Clearly $C_n \subseteq A_n \subseteq B_n$. Also, the sequences $\{B_n\}$ and $\{C_n\}$ are decreasing respectively. Let

$$B = \bigcap_{n=1}^{\infty} B_n = \bigcap_{n=1}^{\infty} \bigcup_{m \ge n} A_m \quad C = \bigcup_{n=1}^{\infty} C_n = \bigcup_{n=1}^{\infty} \bigcap_{m \ge n} A_m$$

The events B and C are denoted by $\limsup_{n\to\infty}A_n$ and $\liminf_{n\to\infty}A_n$ respectively. Show that

- (a) $B = \{ \omega \in \Omega : \omega \in A_n \text{ for infinitely many values of } n \}.$
- (b) $C = \{ \omega \in \Omega : \omega \in A_n \text{ for all but finitely many values of } n \}.$

We say that a sequence $\{A_n\}$ converges to a limit A if B and C are the same set A. We denote this by $A_n \to A$. Suppose this is the case, then show that

- (c) A is an event.
- (d) $P(A_n) \rightarrow P(A)$.

Solution:

(a) Let $\omega \in B$. Then $\omega \in \bigcap_{n=1}^{\infty} \bigcup_{m \geq n} A_m$. Hence $\omega \in \bigcup_{m \geq n} A_m$ for all $n \in \mathbb{N}$. Hence $\omega \in A_k$ for some $k \in \mathbb{N}$. Let k_1 be the least number such that $\omega \in A_{k_1}$. Then we also have $\omega \in B_{k_1+1}$. So we have some $k_2 \geq k_1 + 1$ such that $\omega \in A_{k_2}$. Then $\omega in B_{k_2+1}$. So there exists $k_3 \geq k_2 + 1$ such that $\omega \in A_{k_3}$. Continuing like this at i^{th} step we have some $k_{i+1} \geq k_i + 1$ such that $\omega \in A_{k_{i+1}}$ and so on. So now we got an strictly increasing infinite sequence of positive integers $\{k_1, k_2, k_3, \dots, k_i, \dots\}$ such that $\omega \in A_{k_j}$ for all $j \in \mathbb{N}$. Hence $\omega \in \{\omega \in \Omega : \omega \in A_n \text{ for infinitely many values of } n\}$. Hence

 $B \subseteq \{\omega \in \Omega : \omega \in A_n \text{ for infinitely many values of } n\}$

Problem 4

10% of the surface of a sphere is coloured white, the rest is black. Show that, irrespective of the manner in which the colours are distributed, it is possible to inscribe a cube in S with all its vertices black.

Hint: For a given distribution of colors, select the cube"uniformly randomly" (you should make this more concrete). First note that it is enough to prove that there is a non-zero probability with which all the vertices of this random cube are colored black (why?). Now try to use the union bound from Problem 1(b) above to show this.

Solution: To show that there exists a cube in *S* with all its vertices black it is enough to show that if a random cube is chosen in *S* the probability of all vertices black is greater than 0. Now we have

 $\underset{C \text{ is in } S}{\mathbb{P}} \left[\text{All vertices of } C \text{ is black} \right] = 1 - \underset{C \text{ is in } S}{\mathbb{P}} \left[\text{At least one of the vertices of } C \text{ is white} \right]$

So its is enough to show that $\mathbb{P}_{\substack{C: cube \\ C \text{ is in } S}}$ [At least one of the vertices of C is white] < 1. Now we also have

 $\underset{C \text{ is in } S}{\mathbb{P}} \left[\text{At least one of the vertices of } C \text{ is white} \right] = \underset{X_i \in S}{\mathbb{P}} \left[\exists \ i \in [8] \ X_i \text{ is colored white} \ | \ X_1, \dots, X_8 \text{ forms a cube} \right]$

Now by Union Bound we have

 $\underset{\substack{X_i \in S \\ \forall i \in [8]}}{\mathbb{P}} \left[\exists \ i \in [8] \ X_i \text{ is colored white} \ | \ X_1, \dots, X_8 \text{ forms a cube} \right]$

$$\leq \sum_{j=1}^{8} \underset{\substack{X_i \in S \\ \forall i \in [8]}}{\mathbb{P}} \left[X_j \text{ is colored white } | X_1, \dots, X_8 \text{ forms a cube} \right]$$

So now showing

$$\sum_{j=1}^{8} \mathbb{P}_{\substack{X_i \in S \\ \forall i \in [8]}} \left[X_j \text{ is colored white } | X_1, \dots, X_8 \text{ forms a cube} \right] < 1$$

is enough. Now for any $j \in [8]$,

$$\underset{\substack{X_i \in S \\ \forall i \in [8]}}{\mathbb{P}} \left[X_j \text{ is colored white } | \ X_1, \dots, X_8 \text{ forms a cube} \right] = \underset{\substack{X_i \in S \\ \forall i \in [8]}}{\mathbb{P}} \left[X_j \text{ is colored white} \right] = \frac{1}{10}$$

The last equality because X_j is colored white if it is a point picked from the 10% area of the sphere which is colored white and the probability of that is $\frac{1}{10}$. Therefore we have

$$\sum_{j=1}^{8} \mathbb{P}_{\substack{X_i \in S \\ \forall i \in [8]}} \left[X_j \text{ is colored white } | X_1, \dots, X_8 \text{ forms a cube} \right] = \sum_{j=1}^{8} \frac{1}{10} = \frac{8}{10} < 1$$

Therefore we have $\underset{C \text{ is in } S}{\mathbb{P}}$ [At least one of the vertices of C is white] $< 1 \implies \underset{C \text{ is in } S}{\mathbb{P}}$ [All vertices of C is black] > C

0. Which means there exists a cube in S with all vertices black
